

PXF40-xxWDxx Dual Output DC/DC Converter

9 to 36 Vdc and 18 to 75 Vdc input, ± 12 to ± 15 Vdc Dual Output, 40W

Applications

- Wireless Network
- Telecom/Datacom
- Industry Control System
- Measurement Equipment
- Semiconductor Equipment

Features

- Dual output current up to ± 1.667 A
- 40 watts maximum output power
- 4:1 ultra wide input voltage range of 9-36 and 18-75VDC
- Six-sided continuous shield
- Case grounding
- High efficiency up to 86%
- Low profile: 2.00×2.00×0.40 inch (50.8×50.8×10.2 mm)
- Fixed switching frequency
- RoHS directive compliant
- Input to output isolation: 1600Vdc,min
- Over-temperature protection
- Input under-voltage protection
- Output over-voltage protection
- Over-current protection, auto-recovery
- Output short circuit protection, auto-recovery
- Remote ON/OFF

Options

- Heat sinks available for extended operation
- Remote ON/OFF logic configuration

General Description

The PXF40-xxWDxx dual output converters offer 40 watts of output power from a 2.00 x 2.00 x 0.4 inch package. This series with a 4:1 ultra wide input voltage of 9-36VDC and 18-75VDC, features 1600VDC of isolation, short-circuit, over-voltage and over-temperature protection, as well as six sided shielding. All models are particularly suited for telecommunications, industrial, mobile telecom and test equipment applications.

Test Configurations

Input reflected-ripple current measurement test:

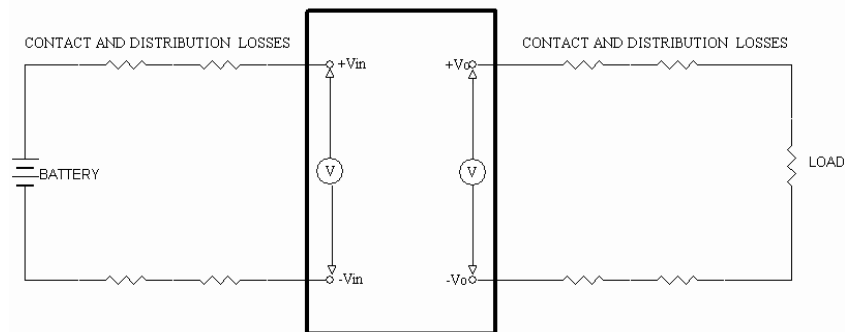

Component	Value	Voltage	Reference
L	12μH	---	---
C	47μF	100V	Aluminum Electrolytic Capacitor

Peak-to-peak output ripple & noise measurement test:

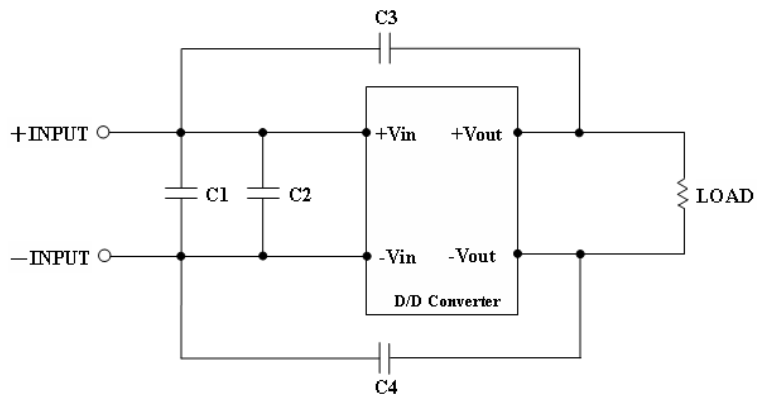

Output voltage and efficiency measurement test:

Note: All measurements are taken at the module terminals.

$$Efficiency = \left(\frac{V_o \times I_o}{V_{in} \times I_{in}} \right) \times 100\%$$

EMC Considerations

Suggested Schematic for EN55022 Conducted Emissions Class A Limits

Recommended Layout with Input Filter

To meet conducted emissions EN55022 CLASS A needed the following components :

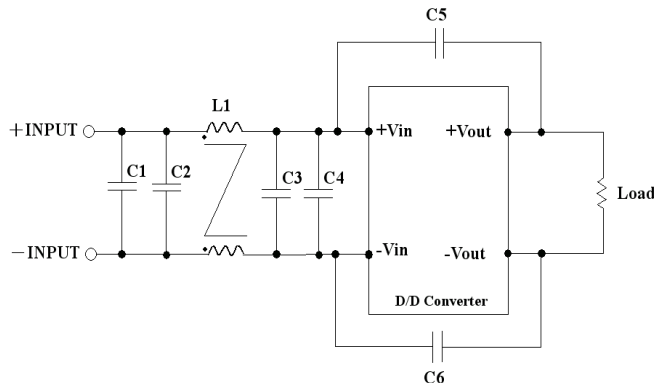

PXF40-24WDxx

Component	Value	Voltage	Reference
C1,C2	---	---	---
C3,C4	1000pF	2KV	1206 MLCC

PXF40-48WDxx

Component	Value	Voltage	Reference
C1,C2	2.2uF	100V	1812 MLCC
C3,C4	1000pF	2KV	1206 MLCC

EMC Considerations (Continued)

Suggested Schematic for EN55022 Conducted Emissions Class B Limits

Recommended Layout with Input Filter

To meet conducted emissions EN55022 CLASS B needed the following components :

PXF40-24WDxx

Component	Value	Voltage	Reference
C1,C3	4.7uF	50V	1812 MLCC
C5,C6	1000pF	2KV	1206 MLCC
L1	450uH	----	Common Choke

PXF40-48WDxx

Component	Value	Voltage	Reference
C1,C2	2.2uF	100V	1812 MLCC
C3,C4	2.2uF	100V	1812 MLCC
C5,C6	1000pF	2KV	1206 MLCC
L1	830uH	----	Common Choke

This Common Choke L1 is defined as follows:

- L: 450 μ H \pm 35% / DCR: 25m Ω , max
A height : 9.8 mm, Max
- L: 830 μ H \pm 35% / DCR: 31m Ω , max
A height : 8.8 mm, Max
- Test condition: 100KHz / 100mV
- Recommended through hole; Φ 0.8mm
- All dimensions in millimeters

Input Source Impedance

The converter should be connected to a low impedance input source. Highly inductive source impedance can affect the stability of the converter. Input external L-C filter is recommended to minimize input reflected ripple current. The inductor has a simulated source impedance of 12 μ H and the capacitor is Nippon chemi-con KZE series 47 μ F/100V. The capacitor must be located as close as possible to the input terminals of the converter for lower impedance.

Output Over Current Protection

When excessive output currents occur in the system, circuit protection is required on all converters. Normally, overload current is maintained at approximately 150 percent of rated current for PXF40-xxWDxx series.

Hiccup-mode is a method of operation in the converter whose purpose is to protect the converter from being damaged during an over-current fault condition. It also enables the converter to restart when the fault is removed.

One of the problems resulting from over current is that excessive heat may be generated in power devices; especially MOSFET and Schottky diodes and the temperature of those devices may exceed their specified limits. A protection mechanism has to be used to prevent those power devices from being damaged.

Output Over Voltage Protection

The output over-voltage protection consists of an output Zener diode that monitors the voltage on the output terminals. If the voltage on the output terminals exceeds the over-voltage protection threshold, then the Zener diode clamps the output voltage.

Thermal Consideration

The converter operates in a variety of thermal environments. However, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the point as shown in the figure below. The temperature at this location should not exceed 105°C. When operating, adequate cooling must be provided to maintain the test point temperature at or below 105°C. Although the maximum point temperature of the converter is 105°C, limiting this temperature to a lower value will increase the reliability of the unit.

Heat Sink Consideration

Use heat-sink (7G-0026A) for lowering temperature; thus increasing the reliability of the converter.

All dimensions in millimeters

Remote ON/OFF Control

The Remote ON/OFF Pin is used to turn the converter on and off. The user must use a switch to control the logic voltage (high or low level) of the pin referenced to $V_i (-)$. The switch can be an open collector transistor, FET or Opto-Coupler. The switch must be capable of sinking up to 0.5 mA at low-level logic voltage. Using High-level logic, the maximum allowable leakage current of the switch at 12V is 0.5 mA.

Remote ON/OFF Implementation Circuits

Isolated-Closure Remote ON/OFF

Level Control Using TTL Output

Level Control Using Line Voltage

There are two remote control options available, positive logic and negative logic.

a. Positive logic:

Module is turned off using Low-level logic

Module is turned on using High-level logic

b. Negative logic:

Module is turned on using Low-level logic

Module is turned off using High-level logic

 TOP VIEW PAD: ϕ 0.079in(2.0mm)
 BOTTOM VIEW PAD: ϕ 0.118in(3.0mm)

Output Voltage Adjustment

Output voltage set point adjustment allows the user to increase or decrease the output voltage set point of a converter. This is accomplished by connecting an external resistor between the TRIM pin and either the Vo(+) or Vo(-) pins. With an external resistor between the TRIM and Vo(-) pin, the output voltage set point increases. With an external resistor between the TRIM and Vo(+) pin, the output voltage set point decreases.

Note 1. Maximum value at nominal input voltage and full load
 Note 2. Typical value at nominal input voltage and full load.

Safety and Installation Instruction

Fusing Consideration

Caution: This power module is not internally fused. An input line fuse must always be used.

This encapsulated converter can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of a sophisticated power architecture. For maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a slow-blow fuse with maximum rating of 8A for PXF40-24WDxx modules and 5A for PXF40-48WDxx modules. Based on the information provided in this data sheet on Inrush energy and maximum DC input current; the same type of fuse with lower rating can be used. Refer to the fuse manufacturer's data for further information.

MTBF and Reliability

The MTBF of PXF40-xxWDxx series of DC/DC converters has been calculated using:

Bellcore TR-NWT-000332 Case I: 50% stress, Operating Temperature at 40°C (Ground fixed and controlled environment). The resulting figure for MTBF is 1.105×10⁶ hours.

MIL-HDBK 217F NOTICE 2 FULL LOAD, Operating Temperature at 25°C °C. The resulting figure for MTBF is 1.511×10⁵ hours.
